Our Portfolio

NFT Website Development

Requirement:

The client intended to create a custom NFT platform with bidding features built-in. The concept was to allow Artists to mint their artwork and sell it. The platform had to provide secure data storage and payment processing methods as well.

Solution:

The solution at the end was where the OpenSea platform was integrated into the backend. So, for every art that an artist uploads in Vtail, that data will be displayed on open-sea with the details of that NFT such as whether it is minted or not. Our team chose the IPFS storage technology, which stores media information in a decentralized manner using the IPFS protocol.

Project Highlights :

Service:
NFT Website Development

Website Revamping

Requirement:

The client wanted to update the website and revamp its design as per the current industry standards.

Solution:

As it was a restaurant business, there were a certain number of updates in terms of design and UI/UX. The team delivered the updated solution as per the client's requirement and with the new fresh website. As per the client's requirement, the team also integrated a calendar for the customers to look at various events that are happening at the place. The team worked with PHP + WordPress.

Survey Application Development

Requirement :

The client required a custom survey tool where they can get a detailed survey of their employees.

Solution :

Techforce created a survey tool that can create online and offline surveys and forms with our user-friendly yet advanced UI. Techforce created a single platform where everyone can create any kind of survey and can draft their own set of questions. With the set of Questions, you can quickly do the Market research and collect the data – it can be online and offline as well.

Project Highlights :

Service:
Software Development

Result:

- Survey Online System (Frontend + Backend) - Admin Panel
- Power BI Desktop Integration
- Multilingual Language Module
- Text to Speech for each question (Integration with Google API)
- Mobile Survey – Sync Online/Offline
- Image/emoticon-based Questionnaire

Tech Stack:
Codeigniter, PowerBi, MySQL, HTML, CSS, JQuery, Third party API Integration

Crypto and Blockchain enabled Financial Asset Management System

Requirement :

The client wanted to develop an asset and product management platform that lets anyone in the world network their favorite financial products. It's a new way of trading that's fairer for everyone.

A Blockchain-based monetary system that allows users to store and trade digital currencies throughout the globe in a variety of crypto and fiat combinations, all from one simple interface.

Solution :

Our Team developed a blockchain based monitory Platform that networks financial products like gold, stocks, bonds, and cryptocurrencies for greater total returns. Investors can avail themselves of discounts on trading and service fees by using FWT Tokens.

The team upgraded the monetary system by redesigning the user interface (UI) of the website. To enhance the potentiality of the website and its applications, we updated its stellar core version and integrated advanced blockchain capacities into it. The team also developed a web application for managing assets from all around the world. Initially the project was to develop an asset management system, but as the world moved to crypto, we moved to developing crypto coins and crypto exchange platform as well.

Food Delivery Application development

Requirement :

The client wanted to create a customized food delivery app. Considering the business growth and expansion, the client wanted to develop a web and mobile application.

Solution :

we provided a solution that was created that allows millennial professionals to effortlessly order food regardless of location, while also ensuring that they save the most time possible by making the entire order processing procedure simple. Before beginning the creation of the product, it was objectively tested to ensure that all the client's objectives were accomplished completely. For business use, the client received a complete ready-to-use solution free of any flaws and weaker aspects.

CHOOSE YOUR MEAL

Smart Payment Routing Solution

Requirement :

Customer payments can often fail at the final checkout stage for simple reasons.Incomplete AVS verification, bank downtime, and internet latency, for instance, can all lead to payment rejection or cart abandonment. This poor customer experience not only results in loss of immediate sales but can also destroy loyalty and long-term sales growth. The client wanted to build a smart payment routing solution.

Solution :

The smart Payment Routing solution consolidates global payment providers into a single integration point, optimizing the cost of complex payment ecosystems.

It is designed to help domestic and cross-border merchants and PSPs improve acceptance, conversion, and payments performance in a cost-effective way

It is based on AI to maximize coverage, carrying out transactions both regionally and globally. This will increase the acceptance of global payments and reduce costs by assessing low transaction rates

Legal Case Management System

Requirement :

The client is a public sector agency of Illinois state. They were required to create and handle the tickets, allotting time for individuals to appear for their hearing in the court and others, which was all done manually. There were many other processes that required digitization as well. This increased the time to resolve a ticket. Our custom solution helped the agency overcome these problems.

Solution :

The system that our team developed had predefined data and is used for the courts located at multiple locations to manage the warrants/tickets generated which need approvals of various authorities for a task to be accomplished/issued. It replaces the manual process with the e-process. It provides all the information related to a task in one place.

Project Highlights :

Service:
Software development

Tech Stack:
Java, Spring MVC, Spring JDBC, Quartz API, MySQL, Hibernate, GWT, Logger, jQuery, TestNG, Twitter Bootstrap, SOAP and REST API, JSF 1.1
